The nucleotide encoding brob may also be used to transform ceries, particularly plant veres, to increase their vitamin A contents (especially in truits and vegetables) and in gene therapy of subjects who have mutated or deleted forms of the bCDD gene and thus low vitamin A levels and susceptibility to developmental or ophthalmological disorders. Antibodies raised against bCDD are used for detection/quantification of bCDD in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Beta, beta-carctone-15,15'-dioxygenase (bOCD) is used for enzymatic conversion of beta-carotene to vitamin A and for raising specific antibodies. Nucleotides encoding all or part of bOD are aseful as primers or probes for specific amplification and/or detection of the gene that encodes bCOD, for isolation of related sequences in other organisms, for determining bCOD levels in humans (to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 17-18; 37pp; English.

The present invention describes primer sets for synthesising 5602 of full-length cDNAs defined in the specification where a primer set occupies. (a) an oligo-dE primer and an oligonucle-otide complementary strand of a polymorheotide which complementary of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of a polymorheotide of the complementary strand of a polymorheotide of the complementary to the complementary strand of a polymorheotide which comprises a 5 end of a complementary strand of a polymorheotide which comprises a 5 end of complementary strand of a polymorheotide which comprises a 5 end of polymorheotide which comprises a 1 end sequence, where the combination of the specification of the specification of the specification of the primers are useful for such those defined in the specification of the specification. The primers are useful for such such and these defined in the specification and/or diagnosts of the attendantly of the proteins encounted by the full-length cDNAs. The primers also useful for the combination of the full-length cDNAs. The primers allow obtaining of the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Primer sets for synthesizing polynucleotides, particularly the $602 full-length cDNAs defined in the specification, and for the detection and/or diagrasis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        02-MAY-2000; 2000JP-0183767

                                                             antibodies. Nucleotides encoding all or part of loop are useful as grimers or probes for specific amplification and/or detection of the paper that encodes born for isolation of related sequences in other organisms, for describing both levels in humans (to identify subjects requiring without A supplementation) and for detecting unclations in the book gene. The nucleotide encoding book may also be used to transform cells, particularly plant cells, to increase their vitamin A concorrs (especially in fruits and vegerables) and in gene therapy of subjects who have mutated or deleted forms of the book gene and thas low vitamin A levels and susceptibility to developmental or ophthalmological disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Local Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         plants. The transpende plants have improved nutritional quality or physiological condition and accumulate vitamin A aldehyde and can take up beta-carotene from the medium. Expression systems encoding beta-diox are useful in the study of beta-diox activity. Identification of cDNAs encoding beta-diox allows the physiological characterization of mammalian vitamin A meriabolism. Vitamin A production in crops and microorganisms can be achieved by transforming the organisms or crops

                                                                                                                                                                                                                                                                                                                                                                   screening of an expression library to identify nucleic acids encoding beta-diox II or the structure of functional domains. The transgenic fund, yeast, insect, animal or plant cells, seeds, tissues, or whole organisms have improved nutritional quality or physiological condition and accumulate important metabolites of carotene/relinoid pathways such as vitamin A aldchyde and retinoic acid, beta carotene from the medium. Expression systems encoding beta-diox II are useful in the study of beta-diox II activity. Identification of cDNAs encoding beta-diox I and II allows the physiological characterisation of mammualian carotene/relinoid metabolism. Vitamin A production in copps and microorganisms can be achieved by transforming the organisms or crops
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    seeds, e.g. corn; oil seeds, e.g. Brassica seeds; edible seeds e.g. palm; edible seeds or seeds with edible parts e.g. chick-peas; potatoes, carrots, sweet potatoes, sugar beets, banana. The polypeptide is useful for diagnostic and/or therapeutic purposes and for preparing antisense or ribozyme type therapeutic agents and for detecting any abnormality of endogenous beta-diox II. The beta-diox II specific antisense oligonuclectides derived from the DNA sequence are useful for dose response studies in relevant models of retinoid/vitamin A deficiency during any stage of an organism's development. The nucleic acids are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    carolene dioxygenase (Beta-diox I). Beta-diox specifically cleaves beta-carotene and lycopene to form beta-apocatotenal and beta-ionone, and apolycopenals, respectively. The DNA is useful for transforming grain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            determining the presence or quantity of beta-diox II nucleic acid and determining presence and amount of beta-diox II The polypeptide is also useful for increasing or decreasing the amount of beta-diox II levels in a cell of tissue which can modify the level of vitamin A and other retholds. Antibodies are useful for studying beta-diox II localisation, recoming full bodies are useful for studying beta-diox II localisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated mouse, human, rebrafish beta caretene diexygenase (beta-diex II) protein that cleaves beta caretene and lycopene to yield beta-apocaretenal and beta-ionome, and apolycopenals, respectively—

Beta-diox specifically cleaves beta-carotene to form vitamin A aldehyde. Beta-diox is is useful for producing transgenic plants. The transgenic plants have improved nutritional quality or physiological condition and accumulate vitamin A aldehyde and can take

Expression systems encoding beta-diox II are useful in the study of beta-diox II activity. Identification of cDNAs
                                                                                                                                                                                                                                                                             microorganisms can be achieved by transforming the organisms or crops
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               apolycopenals, respectively. The DNA is useful for transforming grain seeds, e.g. corn; oil seeds, e.g. Brassica seeds, edible seeds e gralm; edible seeds or seeds with edible parts e.g. chick-peas; potatoes, carrots, sweet potatoes, sugar beets, banana. The polypeptide is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated mouse, human, zebrafish beta-carotene dioxygenase (beta-diox II) protein that cleaves bera carotene and lycopene to yield beta-apocarotenal and beta-ionone, and apolycopenais, respectively
                                                                                                                                                                                                                                                              with the cDNAs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and lycopene to form beta-apocarotenal and beta-ionone, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents the amino acid sequence of zebra-2, beta-carotene dioxygenase (Beta-diox II). Beta-diox specifically cleaves beta-carotene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Von Lintig J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (GREE-) GREENOVATION PFLANZENBIGTECHNOLOGIE GMBH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20-MAR-2000; 2000EP-0105822

The nucleotide encoding brop may also be used to transform cells, particularly plant cells, to increase their vitamin A contents (especially in fruits and vegetables) and in gene therapy of subjects who have mutated or deleted forms of the bCOD gene and thus low vitamin A levels and susceptibility to bCOD gene and thus low vitamin A levels and susceptibility to developmental or ophthalmological disorders. Antibodies traised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Buta, beta-carotene-15,15'-dioxygenuse (bCoD) is used for enzymatic conversion of beta-carotene to vitamin A and for raising specific antibodies. Nucleotides encoding all or part of bCD are useful as primers or probes for specific amplification and/or detection of the gene that encodes bCoD, for isolation of related sequences in other organisms, for determining bCOD levels in humans (to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Beta, beta-carether 15,15°-diexymenase protoin, nucleic acids and antibodies, useful for production of vitamin A from caretene and denotherapy of opthalmological disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Beta, beta carutene 15,15-dickytenase, vilamin A: beta carotene; transformation; fruit; vegetable; developmental disorder; ephthaimological disorder; antibody, detection, quantification;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) (II) is useful for generating antibodies against it, determing or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note. The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensies, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              31-MAR-2000; 2000US-0540217

The gene encoding this protein contains an AAGA deletion at nucleotides 487-490 and is responsible for the disease congenital stationary night blindness (CSNB). The gene is useful for identifying drags which are genetically normal, or are carriers of, or affected with congenital stationary night blindness (CSNB). This allows a breeder to eliminate the carrier from the breeding stock or to breed
                                                                                                                                     25-FEB-1999;

Pred. Not is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 3, Application US/09385259 Patent No. 6201114

GENERAL INFORMATION:
APPLICANT: Aguirre, Gustavo D.
APPLICANT: Aguirre, Gustavo D.
APPLICANT: Acland, Gregory M.
APPLICANT: Ray, Kunal
TITLE of INVENTION: IDENTIFICATION OF CONSENITAL STATIONARY NIGHT BLINDNESS
TITLE OF INVENTION. IN DOGS
FILE REPERENCE. 19603/2481
CURRENT APPLICATION NUMBER: US/09/385,259
CURRENT APPLICATION NUMBER: MS/09/385,259
EARLIER APPLICATION NUMBER: MS/09/385,259
EARLIER FILING DATE: 1998-10-06
NUMBER OF SEQ ID NOS: 8
NUMBER OF SEQ ID NOS: 8
